Parking Management Portal

The Parking Management solution is a robust online parking framework. It has been designed with best practices in parking to present simple, efficient and secure processes related to the purchase and sale of parking! The solution provides substantial benefit to both customers looking for parking and providers that want to sell parking.

For a parking provider the solution enables owners/operators to manage and sell their parking inventory online. Further as customers requests parking that is being marketed on the portal, providers can manage and confirm orders. The solution also provides the ability to utilize on line payment options such as credit card acceptance. The solution is scalable to support operators with multiple lots and locations as well as individuals that have individual spots to sell, such as an empty garage or driveway.

From a parking customer perspective it represents a web portal to search and order parking. Customers can search by location, category and timing of parking. This includes event based one time parking as well as monthly parking. In addition, customers can have multiple parking purchases for vehicles and be able to manage them centrally. This would also support fleet and commercial purchasing, for businesses that want to purchase parking for employees rather than cumbersome expense policies.

As a standalone portal, parking management represents a online forum for multiple supplier to provide parking choices to marketplace. Providing more ways to buy and a central location to search for parking. In addition, the framework can be installed in a homogenous manner for an individual operator to provide a web presence, on-line ordering as well as inventory management in a central repository with their specific branding requirements.
